

747 BIRD WEIGHING

KEEP CLOSE TRACK OF YOUR
ANIMALS' GROWTH

- **Extremely accurate**
- **Extended data storage**
- **Data and graphs on PC**
- **Separate programs for weighing rearers, broilers, parent animals and turkeys**

TOP CONDITIONS THROUGH COMPLETE CONTROL

KEEP CLOSE TRACK OF YOUR ANIMALS' GROWTH

The 747 live poultry weighing system operates extremely accurately and quickly indicates growth differences.

With 1 to 8 weighing scales

The system can be operated very easily. It consists of a computer and between 1 to 8 weighing scales. If they are connected using a network, you can easily bridge large distances. A printer displays all data in clear, graph form.

Durable weighing scales

The weighing scales are made of durable materials which can easily be cleaned or calibrated by the user. With normal use the scales will practically never show any signs of wear and tear. Even after years of intensive use, they will still weigh accurately.

The special turkey weighing scale is made of stainless steel with an anti-slip base. The spacious design and easy access mean that several birds can be weighed simultaneously on one scale. The special construction ensures minimal movement when birds step off the scale. The birds are not afraid to use the scale which results in a high number of reliable measurements.

Computer with clear control panel

The computer is designed for convenience, with a clear display showing all necessary options. Operation is easy. The program offers extensive operational functions. All in all, the 747 adds up to be a unique live poultry weighing system!

PC connection

PC connection is also possible, using modems even over large distances. The animals' growth progress can be followed in curves and table form.

The 747 carries weight

- The computer registers measurements in different ways. It takes the average and expected weights into account, which are calculated from previous measurements. This guarantees an up-to-date, reliable overview.
- The user sets the weight acceptance limits. There are settings to weigh rearers, parent animals, broilers and turkeys. Floor or aviary reared layers can also be automatically weighed.
- Is measurement only required during a certain period of the day? Built-in timers make this possible. The best time to weigh rearers, for example, is just before feeding.
- The computer automatically calculates the standard using the measured values. Simply press a key to view the percentage of birds within the limits.
- The computer has room for 6 growth standards. This enables your results to be compared with figures from the feed supplier or breeding organization.
